

Introduction

Introduction

These instructions are aimed at people familiar with R and familiar with TCGA/GDC platforms and data types. They are intended to introduce the reader to producing the given assessment. These instructions will only rarely, if ever, touch on the appropriateness of the assessment algorithm or interpretation of output. See `MBatch_01_InstallLinux` for instructions on downloading test data.

Algorithm

`AN_Adjusted` performs an ANOVA Adjusted correction taking a `BEA_DATA` object (with data matrix and batch dataframe) and returning either a corrected matrix or a string containing the path to where the data file was written.

Output

The primary output method for `MBatch` is to view results in the Batch Effects Website. Correction algorithms generally do not create graphical output and instead create TSV output files.

Usage

```
AN_Adjusted(theBeaData, theBatchType, thePath = NULL, theWriteToFile = FALSE)
```

Arguments

`theBeaData`

`BEA_DATA` objects can be created by calls of the form `new("BEA_DATA", theData, theBatches, theCovariates)`. If you have no covariate data, use an empty `data.frame` created with `data.frame()`

mData: Object of class “matrix” A matrix where the colnames are sample ids and the rownames are gene equivalents. All names should be strings, not factors.

mBatches: Object of class “data.frame” A data.frame where the column “names” are batch types. The first batch “type” is “Sample”. All names and values should be strings, not factors or numeric.

mCovariates: Object of class “data.frame” A data.frame where the column “names” are covariate types. The first covariate “type” is “Sample”. All names and values should be strings, not factors or numeric.

theBatchType

A string identifying the batch type to correct.

thePath

Output path for any files.

theWriteToFile

TRUE to write the corrected data to file and return the file pathname instead of the corrected matrix.

Example Call

The following code is adapted from the tests/AN_Adjusted.R file. Data used is from the testing data as per the MBatch_01_InstallLinux document. In the future, we plan to make the output from MBatch more user friendly, but currently, this produces the following output at the command line.

```
{
  library(MBatch)

  inputDir <- getTestInputDir()
  outputDir <- getTestOutputDir()
  compareDir <- getTestCompareDir()

  # set the paths
  theGeneFile=file.path(inputDir, "matrix_data-Tumor.tsv")
  theBatchFile=file.path(inputDir, "batches-Tumor.tsv")
  theOutputDir=file.path(outputDir, "AN_Adjusted")
  theRandomSeed=314
  theBatchType="TSS"

  # make sure the output dir exists and is empty
  unlink(theOutputDir, recursive=TRUE)
```

```

dir.create(theOutputDir, showWarnings=FALSE, recursive=TRUE)
# load data
myData <- mbatchLoadFiles(theGeneFile, theBatchFile)
myData@mData <- mbatchTrimData(myData@mData, 100000)
# call
outputFile <- AN_Adjusted(theBeaData=myData,
                           theBatchType=theBatchType,
                           thePath=theOutputDir,
                           theWriteToFile=TRUE)
correctedMatrix <- readAsGenericMatrix(outputFile)
print(correctedMatrix[1:4, 1:4])
}

```

Example File Output

The above code creates the following output file. File is named using the following naming convention: ANY_Corrections-ANAdjusted.tsv The TSV file with the corrected dataset is written by the MBatch package. The end of the output shows a snippet from the corrected matrix.
